

## **Line parameters of water in the near-infrared and visible**

**LINDA R. BROWN and ROBERT A. TOTH, Jet Propulsion Laboratory, California Institute of Technology, Pasadena, CA 91109, USA and MICHAEL DULICK, National Solar Observatory, Tucson, AZ 85726.**

**Recent laboratory studies at several different institutions have resulted in new databases for water at near-infrared and visible wavelengths. The line parameters (positions, intensities and pressure-broadening coefficients) will be summarized and compared. The water at 0.94  $\mu\text{m}$  will be emphasized.**

**The authors wish to thank the National Solar Observatory at Kitt Peak for the use of the FTS and C. Plymate for assistance in obtaining the  $\text{H}_2\text{O}$  spectra. We also thank M. Carleer, C. Camy-Peyret, D. Schwenke and L. Giver for making linelists available to us. Part of the research described in this paper was performed at the Jet Propulsion Laboratory, California Institute of Technology, under contract with The National Aeronautics and Space Administration.
